Avergrad in 1634 **k tradus** Themerasis in 1973

World trade (exports) of centrifugal sugar ioialed 22.7 million metric tons, raw value, in 1973. This was an increase of 4.7 percent over the 1972 level and up by 18.7 percent over the 1965-69 average. World trade over the past decade has increased at a much slower rate than production and consumption.

North America and South America showed substantial increases in sugar trade for 1973, compared with 1972 levels. Exports from Europe, Africa, Asia, and Oceania did not show as much change. Cuba had a larger increase of exports in 1973 than any other country. The increases reflected a significantly higher level of production. At 4.8 million tons, however, exports were still below the 1965-69 average by about 200,000 tons. Argentina and Brazil account for the high level of exports in South

Asserbes in 1973, as exposis from Gryster, even, . A Venezuela were down markedly, to Asio increase, by the Philippines were almost offset by declines for Tholland and Turkey.

World imports of augar amounted to 24.7 million metric tons, up by 3.7 percent over 1972 imports. Imports in the USSR accounted for 700,000 tons of the increase, reflecting a disappointing production year. The 2.6 million tons imported by the USSR compares with 1,942,000 tons for the 1965-69 period. Japan remeal its imports in 1973 to a more usual level. The U.S. accounds for more imports than any other country (21.8 percent). While U.S. imports in 1973 were about the same as (base of 1972, they were about 16 percent higher than 1965-69.

Sugar, centrifugal (raw value): Imports, average 1965-69, annual 1972 and 1973 (In 1,000 metric tons)

 $[\]frac{1}{2}$ Preliminary. $\frac{2}{4}$ Includes trade of other countries not shown separately. $\frac{3}{4}$ Beginning 1965, Swaziland excluded. $\frac{4}{4}$ Crop year ending May of year shown.

Foreign Agricultural Service. Prepared or estimated on the basis of official statistics of foreign governments, other foreign source materials, reports of U.S. agricultural attaches and foreign service officers, results of office research and related information.

PROPERTY OF THE STANDARY OF TH

In 1974, world sublowerseed production is expected to decline slightly from the record 11.5 million metric tons produced in 1973.

If yields are on trend in the USSR, sunflowerseed production in that country will approximate 6.4 million tons!/i, about 400,000 tone less than last year's output despite a stight increase in acreage. This reduction should be substantially offset by 340,000 tons of increased production in Argentina, Romania, Bulgaria, and Yugoslavia.

This spring, Argentina harvested an estimated 1.07 million tons, or about 100,090 tons more than in 1973. The increase resulted from higher yields, since acreage declined by 13 percent.

In Eastern Europe, increased production in Romania and Bulgavia is expected. General rains in the Balkans during July should have provided sufficient moisture for full development of sunflowers. Romania is expected to produce 200,000 tons of seed on 1,483,000 acres harvested. Improved yields and 60,000 more harvested acres are expected to increase Romanian sunflowerseed production by 140,000 tons over last year's output.

Dulgaria devotes 7 percent of its arable land to sunflowers and is expected to produce 500,000 tons of seed in 1974 on an estimated 710,000 acres barvested. This year's 60,000-ton projected increase in seed production primarily reflects increased acreage.

Despite slightly smaller acreage, production in Tugoslavia should mach 475,000 tons in 1974, compared with 433,000 tons harvested last year, because of immoved yields.

The United States, traditionally a producer of 70,000-20,000 matrix lons of santiowerrend for birdfeed each way, began commercial production of smullownssed for erushing in 1967. By 1972 farmers expanded plantings of crushing varieties to 650,000 acres. However, two-thirds of that land, 435,000 acres, was set-aside acceage. In 1974, over half of this acreage returned to wheat, soybeans, and feedgrains with the termination of the set-aside program. Consequently, U.S. production of sunflowerseed is now unofficially estimated at 265,000 tons, down 25 percent or 89,000 tons from last year's except of 354,000 tons.

World sunflower oil production in 1974 is estimated at a record 4.5 million metric tons, or 940,000 tons above last year. The bulk of the increase reflects expanded Soviet output from seed harvested last year. In 1975, world sunflower oil production is expected to decline by 110,000 tons, reflecting reduced Soviet production this year.

World production of sunflowerseed meal increased 845,000 metric tons in 1974 to an estimated 4.3 million tons. In 1975, meal output is expected to decline by 145,000 tons.

Sunflowerseed oil exports in 1974 are estimated at 825,000 tons, oil basis, or 75,000 tons above the 1973 level. In 1975 exports are expected to continue to expand somewhat, reaching 855,000 tons, oil basis.

Exports of sunflowerseed and meal in 1974 are estimated at 640,000 tons, meal equivalent, an increase of 70,000 tons over last year. However, in 1975, meal exports are expected to total only 530,000 tons, meal equivalent, because of reduced seed availabilities in the U.S., Argentina, and Turkey.

In 1973, the major sunflowerseed importers were West Germany, France, and Italy. The Netherlands, Belgium-Luxembourg, Austria, West Germany, and France were major sunflower oil importers.

Reed production adjusted for 8 percent declarge.

^{1/} Southern Hemisphere sunflower crops which are harvested early in the calendar year are combined with those of the Northern Hemisphere which are harvested in the latter months of the same year. 2/ Preliminary. 3/ Includes estimates for minor producing countries. 4/ Includes production from intercropping. 5/ Adjusted official estimates, that is official Soviet data "barn yield" less 8 percent dockage. 6/ Commercial crop only. 7/ Includes estimates for the People's Republic of China as well as for minor producing countries. 8/ Projected on the basis of an estimated 11.6 million acres and an assumed average yield of 1,140 pounds per acre.

Foreign Agricultural Service. Prepared or estimated on the basis of official statistics of foreign governments, other foreign source material, reports of U.S. Agricultural Attaches and Foreign Service Officers, results of office research, and related information.

1/ Total harvested in previous calendar year except Argentina where harvested in the year indicated. Oil production for the USSR estimated on the basis, of 95 percent of the seed harvest adjusted for 8 percent dockage assumed extraction rates of 38 to 45 percent. Oil production for all other countries estimated on the basis, 92 percent of seed harvested using average oil extraction rates of 28 to 35 percent. 2/ Preliminary. 3/ Forecast. 4/ Exports of seed expressed as oil using assumed extraction rates as indicated. 5/ Bulgarian exports of sunflower seed are prohibited from this year on. 6/ Unofficial data compiled from trade sources and selected state reports.

Sunflowerseed: Production and exports by selected producer-exporters and the world, annual 1960-74 and 1975 forecast (In 1,000 metric tons)

WORLD PRODUCTION AND TRADE OF COPRA AND COCONUT OIL

Production

World production of copra in 1974 is estimated at 2.5 million metric tons (oil equivalent), up 2 percent, or 44,000 tons, from that of 1973. Last year's production was down as a result of lack of rainfall in principal producing areas. The 1973 oil production of 2,471,000 metric tons was down 11 percent or 293,000 metric tons from the high production of 2,764,000 metric tons in 1972. Production generally was stable throughout much of the 1960's, but increased rather sharply in 1971 and also in 1972. It is likely that production in 1975 will be almost back to the 1972 level.

Almost three-fourths of the copra is produced in four countries, the Philippines, Indonesia, Sri Lanka, and New Guinea. Combined production of copra in 1974 in these countries, in terms of oil, totaled 1.9 million tons or about 74 percent of the world output of 2.5 million tons. In 1960 these countries produced 69 percent of the total, 70 percent by 1965, and 70 percent in 1970. Only in the past few years has the proportion produced by the major producers/exporters increased somewhat.

The leading producer of copra is the **Philippines**. In 1974 its production of copra, in terms of oil, is expected to reach 1,120,000 tons, almost 45 percent of the world's total output. Its production is down about 2 percent from the 1973 level as a result of the rainfall shortage that started in early 1972 and continued through January 1974. With rainfall back to normal or above-normal levels, production in the Philippines could increase by 14 percent to 1,280,000 metric tons in 1975.

Indonesia is the second largest producer of copra. Its 1974 output, in terms of oil, is expected to total 567,000 metric tons, up 2 percent from that of 1973. There should be a slight increase in Indonesian copra production in 1975.

Sri Lanka's 1974 production of copra (oil equivalent) is estimated at 96,000 metric tons, representing some improvement over the low level of 67,000 metric tons in 1973. The low level of production in 1973 was because of severe drought conditions. In addition, lack of fertilizer and uncertainty about the Land Reform Law helped contribute to the 1973 decline, which was only 41 percent of the 1972 level. Production is improving and the 1975 level may reach 134,000 tons.

Production of copra in Papua New Guinea during 1974 should be up about 15 percent from the previous

year's level, and, on an oil equivalent basis, total 77,000 metric tons. Production in 1975 probably will be at about the same level.

Copra also is produced in India, Malaysia, Mexico, Fiji, French Pacific Islands, New Hebrides, Mozambique, and some other tropical countries.

Exports

World exports of copra and coconut oil in terms of oil are expected to exceed 1.2 million metric tons this year, up slightly from those of 1973. There probably will be further increases in 1975 to about the 1.4 million ton level.

The four major producers/exporters may export 1,045,000 metric tons of copra (oil equivalent) and coconut oil in 1974, about 84 percent of the world total. However, during 1973 and 1974 several copra and coconut oil producing countries imposed restrictions on exports. The Philippine export tax differentials imposed in February 1974 sharply curtailed its copra exports. By mid-1974, further administrative decisions, apparently in an effort to boost coconut oil prices on the world market, have added to the uncertainty of future coconut oil exports.

Sri Lanka banned copra and coconut oil exports in an effort to assure adequate domestic supplies. Indonesia continued its restrictions on exports of copra and coconut oil. Export restrictions have reduced considerably the availability of copra and coconut oil entering world trade in the first half of 1974, and may continue to limit exports into early 1975.

The Philippines is the biggest producer of coconut oil and also the main exporter. Copra and coconut oil exports during January-June 1974 totaled 277,000 metric tons (oil equivalent), down 44 percent from the same period in 1973. Shipments of copra in June 1974 were only 18,600 metric tons, compared with 81,400 metric tons for the same month last year. Coconut oil exports in June were 34,500 metric tons, 13 percent below the 39,600 metric tons in June 1973. Exports for all of 1974 are forecast at 850,000 metric tons (oil equivalent), down 4 percent from the 902,000 tons in 1973.

The 1975 forecast of exports from the Philippines (oil basis) is for 1 million tons. This would be 71 percent of the world's total exports, expected to reach 1.4 million tons.

Indonesia only exports about one-fourth of its copra crop and historically, most of this has been as copra. Since 1973 there have been restrictions on copra exports. Its 1974 exports, in terms of oil, are forecast at 70,000 metric tons with 1975 exports likely to be at about the same level.

Exports from Sri Lanka reached a low of 20,000 metric tons (oil basis) in 1973. In recent years, most of the exportable part of the crop has been exported as oil.

About half to two-thirds of production is exported. Exports this year, in terms of oil, will be about 50,000 metric tons, increasing to 80,000 metric tons in 1975.

New Guinea exports most of its copra crop with about two-thirds of it going as copra and one-third as oil. Exports in 1974 and 1975 are both forecast at 75,000 tons (oil basis).

1974 WORLD FISH OIL PRODUCTION, (EXPORTS RECOVER FROM 1973 LOW)

World production of fish oil in 1974 is now forecast at 1,020,000 metric tons, an increase of 28 percent or 225,000 metric tons above the 795,000 tons produced in 1973. The 1973 production level was the lowest since 1965. Fish oil production is expected to continue upward in 1975 and may reach 1,090,000 metric tons.

Peru will likely be the major producer of fish oil again in 1974 after having lost that position in 1973 because of the extremely poor harvest of anchovies last year. Fish oil production was only 40,000 tons in 1973, lower than any annual Peruvian output in the 1960's. This year, production could reach 300,000 metric tons, particularly if the favorable yields of oil obtained during the spring fishing season continue this fall. Production in 1975 might increase to 340,000 tons.

Norway probably will produce only about 160,000 tons of fish oil this year, compared with 185,000 metric tons in 1973. The lower quotas for capelin are partly responsible for the decline. Next year there could be a slight increase in production.

Fish oil production has been increasing in the United States following a low of 54,000 metric tons in 1967. Output in 1973 exceeded 100,000 tons and in 1974 probably will reach 120,000 metric tons. It is likely that 1975 production will at least equal that of the current year.

South African fish oil production in 1974 is forecast at 72,000 metric tons, unchanged from 1973. Next year, production could be slightly higher.

Icelandic production of fish oil was at a low of 11,000 metric tons in 1971 but returned to a level of about 30,000 metric tons in 1973. This is still only one-fourth of the peak production of 130,000 tons in 1966.

The above five principal producer-exporters produced 54 percent of the total 1973 fish oil and will probably provide about two-thirds of the total 1974 output with Peru being back in the picture at more normal levels. Fish oil production in other countries will probably run somewhat lower in 1974 than in 1973. However, to the extent that current high prices make it more attractive to produce this oil rather than buy it on the world market, there could be some increases that would result in even higher total fish oil production this year.

Exports

Exports of fish oil in 1974 may total 550,000 metric tons, up about 28 percent or 121,000 metric tons from the low level of 429,000 metric tons in 1973.

World exports could be as high as 650,000 tons in 1975, about equal to other recent more normal high years. The bulk of world exports will come from the major producer-exporters. The five principal countries may export 430,000 tons in 1974 and 525,000 tons in 1975.

Peruvian fish oil exports were nearly zero last year, but could reach 150,000 tons in 1974 and 230,000 in 1975. The record year was 1968, when 323,000 metric tons were exported. Shipments dropped after that, but increased to 276,000 metric tons in 1971 and 293,000 metric tons in 1972.

Norway exported 123,000 tons in 1973, will probably drop to about 110,000 metric tons this year, and may increase to 125,000 tons in 1975. Norway exported 245,000 tons of fish oil in 1967 and in 1969 had a good year with exports of 223,000 metric tons.

Exports from the **United States** appear to be on a plateau of 100,000 tons for this year and next. U.S. exports of 108,000 metric tons in 1973 were a recent record, and since 1960 have been exceeded only by the 112,000 tons in 1963.

South African exports of fish oil were 40,000 tons last year, and will be about the same this year but may increase slightly in 1975. This is still sharply below the record year of 1968 when 106,000 metric tons were exported.

Exports of fish oil from Iceland will probably run around 30,000 metric tons this year and next, representing increases over recent low years. Iceland had a good fish catch in 1966 when production was high and exports reached 133,000 metric tons. Since then there has been a general decline that appears to have bottomed out in 1971.

Other countries are likely to export 120,000 metric tons of fish oil in 1974, down from 132,000 metric tons last year. Their exports in 1975 should be slightly higher. Denmark, Angola, and Japan will export the bulk of the 120,000 metric tons.

The leading importer of fish oil is the United Kingdom. In 1973, fish oil imports to the United Kingdom were 207,000 metric tons. The United Kingdom normally imports 150,000-200,000 metric tons annually, but in 1967 imports totaled 265,000 metric tons.

West Germany is the second leading importer of fish oil with 117,000 metric tons in 1973. This was the lowest

volume since 1967, when less than 100,000 tons were imported. The following year imports increased to 158,000 metric tons.

The **Netherlands** is the third leading fish oil importer. Its imports were 111,000 metric tons in 1973, compared to 120,000 metric tons in 1972, and 137,000 metric tons in 1968.

WORLD WOOL PRODUCTION UP IN 1974 SEASON

World wool production in the 1974 crop year (July-June) is expected to total 2.6 million metric tons—up about 4.5 percent or 115,000 metric tons from the 1973 level. Most of the increase is expected to come from Australia and New Zealand, resulting from increases in sheep numbers there. Production in the United States is expected to be down 8 percent, owing to fewer sheep shorn. Fleece weights in the United States are expected to be unchanged from last season's level of 8.25 pounds.

The outlook for larger wool production next year is good. Producers in Australia and New Zealand, dissatisfied with lower cattle prices, are expected to lean more towards sheep raising this year despite lower expected wool prices.

1974 WORLD FISHMEAL OUTPUT UP SHARPLY FROM 1973

World fishmeal production is expected to be up almost 25 percent in 1974 from the 1973 level. The 3,529,000 tons production in 1973 was the lowest world output since 1965. In 1974, production could reach 4.4 million tons if the Peruvian fall fishing season is reasonably successful. By 1975, production could increase to 5 million tons. The record year in world fishmeal production was in 1970, when it reached 5,347,000 metric tons.

Six major producer-exporters—Peru, Norway, South Africa, Chile, Denmark, and Iceland—are expected to produce 2,255,000 metric tons this year or 51 percent of the world total. Next year they are forecast to produce about 57 percent of the total. In the early 1970's these countries represented 62-63 percent of the world total. Production from these six countries dropped to 1,496,000 metric tons last year, the lowest since 1961. The decline was largely the result of the low Peruvian harvest of anchovies because of the temporary change in the Peru current and resulting anchovy population decline.

Peruvian Fishmeal Situation Improved in 1974

Even with its low output of 423,000 metric tons, Peru held its lead as the principal producer among these six countries in 1973. Both Japan and Russia produced more fishmeal than Peru last year, but these countries only export small quantities and Japan is a net importer.

The Peruvian situation has improved and production this year could reach 1.2 million tons. During the first 5 months of 1974, Peru's fleet harvested 2.45 million tons of fish yielding 540,000 metric tons of fishmeal. The fall season will start in September or October.

The Peruvian Institute of the Sea recently released the results of the May study. These scientists were cautious and recommended continued care in the management of the resource. Their estimate of the anchovy stock in the sea was 5-7 million tons, about the same as in November 1973. However, there had been a 2.45-million-ton harvest during that period. Fishmeal yields so far in 1974 have been favorable. If there continues to be improvement in the Peruvian anchovy situation, a 1975 forecast of 1.7 million tons seems reasonable.

Norway Fishmeal Output Down This Year

Norway's fishmeal production is expected to decline to 280,000 metric tons in 1974 from the level of 350,000 metric tons in 1973. With international catch restrictions

for capelin (a member of the smelt family) and North Sea herring, and national regulations also applied, it seems unlikely that its 1975 fishmeal production will exceed 1974 levels.

Other Major Fishmeal Producers

South African production in 1974 will be about the same or slightly lower than that of 1973. Its production of 280,000 tons in 1973, an increase of 14 percent over 1972, was possible because of abundant anchovies during the year. This put South Africa (including South West Africa) in a unique position to take advantage of the market situation created by the decline in Peruvian anchovy population.

Chilean output of fishmeal declined to 73,000 metric tons in 1973. Production is forecast at 120,000 metric tons this year, increasing to 200,000 metric tons in 1975. Its record year was 1971, when 263,000 metric tons of fishmeal were produced. Chile's 1973 output was the lowest since 1961.

Production of fishmeal in **Denmark** in 1973 reached 270,000 metric tons, up 8 percent from the 250,000 metric tons in 1972. Fishmeal production will be around this level or slightly higher this year and next. Over the longer run Denmark, too, will be caught up in the problem of limited catch provisions.

Iceland produced about 100,000 metric tons of fishmeal in 1973 and will probably do as well or even some better this year and next. One recent development in the Icelandic fishmeal industry has been the diversion of some capelin from processing for fishmeal to the frozen export market to Japan for human consumption. It is estimated that up to 40,000 tons of capelin will be sent to Japan in 1974, over double the 1972 and 1973 levels. Japan is a fairly new market, and in 1971 only 4,000 tons were shipped. Lack of freezing capacity in Iceland is apparently the current limiting factor since some sources visualize an eventual market of as much as 200,000 metric tons.

Other Producing Countries Show Four Percent Increase Over 1973

Countries other than the six major producer-exporters may have a fishmeal output of about 2.1 million tons in 1974, up about 4 percent from last year's level. There likely will be another slight increase next year. Japan and Russia are important fishmeal producers. The United

States produced 316,000 metric tons of fishmeal last year and output will likely remain around that level this year and next.

Historically, the United States has been a net importing country. Canada produced 49,300 tons of fishmeal last year, but its production was as high as 127,300 metric tons in 1969. Angola, also an exporter, produced 93,000 metric tons in 1973. The United Kingdom and West Germany produce 70,000-80,000 tons of fishmeal each year.

1974 World Exports of Fishmeal Well Above 1973

Exports of fishmeal on a world wide basis in 1974 will probably total over 2.2 million tons, up almost 49 percent from the low level of 1,520,000 metric tons last year. That was the lowest export level since 1961 and had a marked effect on the world feed price level. Exports in 1975 may be as high as 2.7 million tons.

The six fishmeal producer-exporters accounted for 80 percent of world exports in 1973 and will likely export 85 percent of the 1974 total. In earlier years an even greater proportion of the world total was exported by these countries.

Peruvian exports this year could reach 1.1 million metric tons after last year's low level of 351,000 metric tons. Next year, exports could be as high as 1.5 million tons.

Exports from Norway this year will likely be only around 260,000 metric tons, down 20 percent from the 327,000 metric tons shipped last year. For 1975 exports are forecast at about the 1974 level.

Including exports from production on factory ships, South African exports of about 175,000 metric tons in 1974 will be at about the same level as in 1973.

Chilean exports will probably increase to 80,000 metric tons this year over 1973's level, and may reach 100,000 metric tons in 1975. Exports last year were the lowest since the early 1960's.

Fishmeal exports from Denmark were about 211,000 metric tons in 1973, and will probably be slightly higher this year.

Icelandic exports of fishmeal this year and next will probably be about 100,000 metric tons. This will be above other recent years but below export levels reached in the mid-1960's.

Exports from other countries will probably only total 330,000 metric tons in 1974, up 5 percent from 1973, and could increase another 3 percent next year. Angola is one of the fishmeal producers that exports much of its production. Morocco also is a net exporter.

Several of the major importers of fishmeal also export the product. West Germany, for instance, imported 265,000 tons of fishmeal in 1973 and exported 42,000 tons. France imported 49,000 metric tons that year and exported 22,000 metric tons. While the United Kingdom was a large importer in 1973 with 316,000 metric tons it only exported 10,000 metric tons that year. Historically, it has not exported but has imported as much as 499,000 metric tons in 1968.
